Executive Summary

The Economy of Canyon County

Introduction

This is a study of the Canyon County economy with a focus on agriculture and high technology manufacturing. Canyon County has been one of the fastest growing counties in Idaho during the 1990s. What effect might new growth have on existing agriculture? How important is agriculture to the county's economy? Is new growth a substitute for agriculture or is it a complement? These are the important questions addressed in this report.

A major cause of Canyon County's growth is from the attraction of new businesses and the expansion of existing local industries and businesses. A second important cause is from the spill-over growth to Boise City and Ada County from the east. Canyon County has a robust economic base including the second largest value of agricultural output of all of the state's counties along with a large manufacturing and high technology sector. The county is also a bedroom community for Boise. Canyon County is providing Boise with housing for its rapidly expanding economy. Since 84.3% of the land area of Canyon County is in agriculture, policy makers are faced with difficult questions. Canyon County is a tale of two worlds: One urban — one rural. The economy also reflects two contrasts: One based on agriculture and other natural resource industries and one based on rapidly growing high technology and service companies. These two separate economies reflect the past, present, and future of all of Idaho.

Economic and Social Demographics

This report analyzed many key social and economic variables: The following summarizes the conclusions of this analysis:

- 1) Idaho's overall economic performance over the last decade has made it one of the five fastest-growing states in the nation.
- 2) Canyon County population growth was ranked fifth in the state at a 39.8% growth rate from 1990-1999. Overall, Canyon County is the second largest county in terms of population at 139,821.
- 3) Canyon County is one of the state's largest agricultural counties. It ranked 17th out of 44 counties in terms of land area in farm acres. In terms of cash receipts from agriculture, however, Canyon County ranked 2nd in the state only behind Cassia County.
- 4) Approximately 84% of Canyon County is agriculture and nearly 93.6% of Canyon County is in private ownership. In contrast 31.6% is in private ownership for the State of Idaho.
- 5) Canyon County faces pressure given its land use characteristics. Most of its land is in agriculture and in private ownership. The county faces rapid population growth both from the east from Boise and from within.
- 6) The demographics of Canyon County illustrate a county with a robust economy, but also an economy with problems. It ranked 9th in the state in poverty levels. In terms of average family income, it was 28th in the state. The county ranked 39th in the state in the percentage of population receiving a high school degree; 27th in the state in the percent of the population with a bachelors degree; and 6th in the state in the percent of the population with less than a 9th grade education. Canyon County ranked 5th in the state in the incidence of serious crime, reflecting urbanization.
- 7) One interesting demographic characteristic of Canyon County is its diversity. Hispanics constitute nearly 20% of the county population.

Employment and Earnings

From an economic profile perspective, the largest single economic sector in Canyon County is services, employing 14,308 in 1998 or 24% of the workforce. The second biggest sector is manufacturing (19%) in Canyon County. Retail trade constitutes the 3rd largest sector for Canyon County constituting 15.5% of the employment. Overall, total employment in 1998 was nearly 60,000 workers. From 1990-1999, Canyon County experienced a 42.2% increase in employment growth.

The causation of economic activity in Canyon County, can be estimated utilizing an input/output model of the economy, which can be used to illustrate an economic base assessment. For example, the trade sector (retail and

wholesale trade) which officially employs 19.2% of the county's employment is *actually* responsible for 1.9% of the region's employment. This occurs because most of retail trade is endogenous to the economy, dependent on other industries that bring money into the county from outside the region. From the economic base, we can see that total agriculture and agricultural processing constitutes 32.4% of total sales in Canyon County, 22.7% of value added, 20.8% of wages, 26.1% of indirect business taxes, and 23.6% of employment. Manufacturing constituted 27.1% of sales, 24.6% of value added, 25.3% of wages, 19.8% of indirect business taxes, and 20.5% of employment. Roughly 39% of all jobs in the manufacturing sector come from high-technology related jobs. Two other major export or basic industries include state and local government (11.2%) of employment; transfer payments 12.9%; and dividends, interest, and rents – DIR 6.9%.

Issues for the Future

What does the future hold for Canyon County? Agriculture related industries constitute 32.4% of sales and 23.6% of employment. Agriculture is a mature industry, however, and not likely to have opportunities for major expansions. It will, however, have opportunities for expanding niche markets, both in specialty crops and agricultural related businesses. The bulk of the future expansion will like occur from three sources: 1) expansion of existing businesses, 2) new businesses and industries moving into the region—many in the high technology and service sectors, and 3) residential growth from Boise. Growth creates both opportunities and challenges.

Several key issues emerge when considering the effects of economic growth: 1) Is the newly expanding high technology and service economy in conflict with the existing economic base of Canyon County (primarily agriculture)? 2) What is the economic cost of reducing or eliminating the older basic industries in Canyon County such as agriculture? 3) Can Canyon County have new growth while maintaining its older economic base?

Economic Value of Agriculture in Canyon County

Using an economic base approach, the total economic value of cultivated farm ground can be estimated on a per farm or per acre measure. Each acre of cultivated farm ground is worth \$8,534 of sales per year, \$1,372 of wages, \$204 in indirect business taxes, and 0.071 in jobs. This is based on total agriculture related economic impacts of: sales \$1,678,502,979, value-added of \$513,649,363, earnings \$269,933,121, indirect business taxes \$ 40,104,450, and 14,015 jobs. Total harvested cropland consisted of 196,689 acres. For each average size farm in Canyon County, total sales is \$1,245,180; total wages is \$200,000; total indirect business taxes is \$29,751; and total jobs is 10.4. Total number of farms as estimated by the United States Department of Agriculture (USDA) was 1,348. Since food and meat processing are directly tied economically to farm output, these impacts are included in this analysis. The average size farm in this analysis has 145.9 harvestable acres.

Economic Trade-offs

Manufacturing is the second largest basic industry in Canyon County. Nearly 40% of the employment in manufacturing is in high technology companies. Expansion of these economic sectors will be an important growth engine in the future. The character of this growth is important, however. If the new manufacturing facilities and housing tracts of the employees locate on irrigated farmland, then this growth comes with an economic trade-off. Every acre taken out of production will reduce aggregate economic sales in the county by \$8,535. The benefits of new manufacturing jobs would have to be weighed against the cost of lost agriculture-related sales. On the other hand, if new manufacturing facilities and related employee housing tracts are located on land other than irrigated farmland, then this trade-off does not occur and a “win-win” situation results. The same is true with the expansion of any other industries, services, or retail trade.

Conclusions

Future unplanned growth in Canyon County could threaten its agricultural base, the largest source of employment and economic activity in the county. Every acre taken out of agriculture for new residential development reduces overall economic activity in the county's economy by almost \$9,000 per year. Policy makers should carefully consider the character of future growth in the county. If new growth is directed onto nonagricultural land, it is possible to accommodate both the urban needs of the county while preserving county's agriculture base.

The Economy of Canyon County

Introduction

This is a study of the Canyon County economy, with a focus on agriculture and high technology manufacturing. Canyon County has been one of the fastest growing counties in Idaho during the 1990s. One major cause of this growth is from the attraction of new businesses and the expansion of existing local industries and businesses. A second important cause is from the spill-over growth from Boise City and Ada County to the east. Canyon County has a robust economic base including a large manufacturing and high technology sector. The county is also a bedroom community for Boise. Canyon County is providing Boise with housing for its rapidly expanding economy. Since 84.3% of the land area of Canyon County is in agriculture, policy makers are faced with the questions: What effect might new growth have on existing agriculture? How important is agriculture to the county's economy? Is new growth a substitute for agriculture or is it a complement? These are the important questions addressed in this report.

Overview of Canyon County

Canyon County is a small centrally located county in southwest Idaho. It is bordered on the north by Payette and Gem Counties, on the east by Ada County, and on the south by Owyhee County. Canyon County's southern border is the Snake River and to the west is the state of Oregon.

Canyon County is a tale of two worlds: One urban — one rural. The economy also reflects two contrasts: One based on agriculture and other natural resource industries and one based on rapidly growing high technology and service companies. These two separate economies reflect the past, present, and future of all of Idaho. They complement each other and also compete with each other for resources. This report is an analysis of Canyon County's economy and the challenges it faces in the present and future.

Geography and People

Idaho's economy is divided into three, integrated regional economic areas. The regional economic area for northern Idaho is centered in Spokane, Washington. Boise is the center of the economic area for southwestern Idaho; and Salt Lake City, Utah, for southeastern Idaho. Idaho's political boundaries bear little relationship to its economic boundaries (Figure 1). North Idaho, as far south as Grangeville, is

dominated by the Spokane, Washington orbit. Southwestern Idaho, eastern Oregon, and northern Nevada falls in the Boise orbit (Ada and Canyon Counties). Southeastern Idaho from Twin Falls to the Wyoming border is in the Salt Lake City orbit. Spokane, Washington; Boise, Idaho; and Salt Lake City all represent the “central place” of the surrounding hinterlands. The central place is the focus of economic activity for each hub. It is where major industries are located, where the majority of shopping and retail trade establishments exist, and where medical centers and other vital services are located.

Canyon County is part of the Boise, Idaho central place. Indeed it faces direct pressures from Boise region urban growth, primarily from the east. Growth is also occurring from within Canyon County in Caldwell, Nampa and other cities and towns.

Population Growth

Idaho’s overall economic performance over the last decade has made it one of the five fastest-growing states in the nation. In terms of total population, the state grew 29% from 1990 to 2000 as opposed to 3.1% for the nation. Only two states grew faster. Arizona (40%) and Nevada (66.3%). By April 2000, Idaho’s population had reached 1,293,953 (Figure 2). This growth is in sharp contrast to the 1980s, particularly the first half of that decade, when Idaho actually had a net loss of people. Canyon County was the fifth fastest growing county in the state with a 39.8% population growth from 1990-1999 (Figure 3). Overall, Canyon County is the second largest county in Idaho in terms of population at 139,821 people (Figure 4), a position it has held for decades. Since 1990, the county’s population grew from approximately 90,000 to its current level of 139,821 (Figure 5). Canyon County’s cities and towns have had rapid growth also in the 1990s. Nampa (the largest city) grew 83% from approximately 28,000 to 52,000. Caldwell, the second largest city grew 40%. Middleton grew 61%, and Melba grew 74% (Figure 6).

Idaho’s spectacular growth has been unevenly distributed throughout the state. Boise County grew 77.8% from 1990–1999; Teton County, 65%; Kootenai County, 51%; Ada County, 41.7%; while Butte and Shoshone Counties declined approximately 1%. According to *Profile of Rural Idaho*, eighteen rural Idaho counties experienced population declines in the 1980s. From 1990–1998, four counties lost population. From 1997–1998, fourteen rural counties and one urban county, Latah, experienced decreases in population.

Population growth does not necessarily imply economic well-being. Incomes and output need to grow as well if per capita incomes are to increase.

2000	139,821	55.2%

Rural Versus Urban

There is a clear dichotomy in the State of Idaho's economic performance. One is the urban-rural split. Most of the gains in income and population have occurred in the urban regions. The second dichotomy is between the traditional natural resource industries (farming, mining, wood products, etc.) and newly emerging high technology and service industries. Most of the new growth is in high technology and related service industries.

According to the U.S. Bureau of the Census, rural is defined as any place with fewer than 2,500 residents and not included in an urbanized area. By this measure, 40% of Idaho is rural. A more traditional definition of urban is the Metropolitan Statistical Area (MSA), which is defined by the census bureau as a county or group of counties containing a place with a population of 50,000 or more. In Idaho, there are only two MSAs—Boise, which includes Ada and Canyon Counties, and Pocatello–Idaho Falls, which includes Bannock County. By this standard, 61.7 % of the state's population is non-metropolitan.

The Idaho Department of Commerce classifies 61.5% of Canyon County population as urban, up from 51.1% in 1980. Idaho's population is now classified as 62.4% urban, up from 54% in 1980 (County Profiles). As noted earlier, most of the population growth in the state has been in the urban regions. Strong economic gains have followed this growth. Rural regions, on the other hand, have faced economic stagnation and in some cases, population decline. They face the problems of attracting new businesses and keeping the existing industries from closing or leaving. The urban regions, on the other hand, have faced rapid growth and growth-related population pressures. The state's population base has been shifting from rural to urban areas—mainly in Ada County/Canyon County (Boise) and Kootenai County (Coeur d'Alene).

Traditional, natural resource-based industries are declining either in absolute or relative to other industries. The emerging high technology and service-related industries, including tourism, have gained an increasing share of the economy. The areas of the state where high technology or service industries are located have benefited from faster-than-average economic growth. Communities dependent on wood products and mining have experienced economic stagnation and declining income and employment. Agriculture is holding its own in absolute economic terms (i.e. sales and income) but it is declining in a relative sense because other industries have much faster growth rates.

Canyon County Historic Population Growth

Canyon County is in the middle of a periodic boom paradox. Its period of rapid growth occurred in the following decades: 1990-2000 (55.2%); 1970-1980 (36.7%); 1940-1950 (30.8%); 1930-1940 (32.5%). The decades of slow growth were 1980-1990 (7.5%); 1960-1970 (6.3%); and 1950-1960 (7.6%). In no case did Canyon County lose population (Figure 7).

A Clash of Economies

Idaho as a state is a paradox consisting of some of the most remote and rural portions of Idaho along with some of the fastest urban growth regions. Idaho ranks 11th in the nation in terms of land area (excluding water). Idaho County alone is bigger than the states of New Hampshire and Massachusetts (Figure 8). Canyon County is a small county with approximately 590 square miles. In terms of population density, Idaho has 15.6 people per square mile as opposed to 79.6 in the USA. For purposes of comparison it is interesting to note that Idaho County has 1.8 persons per square mile, Canyon County has 222.9 persons per square mile, and the District of Columbia has 7691.2 (Figure 9).

Interestingly, Canyon County is one of Idaho's largest agricultural counties, ranking 17th out of 44 counties in terms of land area in farm acres (Figure 10), with over 354,919 acres in 1997. Bingham County was first with 769,065 acres in farms. Shoshone County was last with 4,100 acres. Overall, Idaho State had 11,830,167 in farm acres. In terms of cash receipts, Canyon County ranked 2nd in the state, behind Cassia County (Figure 11). Thus Canyon County is a paradox...one of the most urban counties in the state and yet 2nd in the state in agricultural receipts.

Land Use and Ownership

Approximately 84% of Canyon County is farmland, 7.7% rangeland, 3% forest, and 2% water. Approximately 2.9% is in urban use, versus 0.4% in the State of Idaho, and virtually 0% for Idaho County (Figure 12). Nearly 93.6% of Canyon County is in private ownership. In contrast 31.6% is in private ownership for Idaho and 15.2% for Idaho County. Over 63% of the State of Idaho is owned by the federal government versus only 5.4% of Canyon County. In contrast 83.3% of Idaho County is owned by the federal government (Figure 13).

Canyon County faces pressure given its land use characteristics. Most of its land is in agriculture and in private ownership. The county faces rapid population growth both from the east from Boise and from within.

Demographic and Social Characteristics

The demographics of Canyon County illustrate a county with a robust economy, but also an economy with problems—much like the State of Idaho. In 1997 Idaho ranked 21st in the nation in poverty (13%). New Mexico had the highest poverty rate in the nation (19.3%) and New Hampshire the lowest (7.5%). In Idaho, Canyon County ranked ninth highest in poverty at 16%. Owyhee had the highest poverty in the state (21.4%) while Camas County was the lowest at 7.4%. Interestingly, Ada County had only an 8.9% poverty rate. Thus Canyon County is not fully sharing in the benefits of urbanization that clearly are benefiting Ada County. In average family income, Canyon County was 28th in the state at \$31,558. Blaine County was first at \$45,504 followed by Ada County at \$43,3421 (Figure 14). In 2000, the State of Idaho ranked 39th in the nation at \$37,462. Ada County is considerably above Idaho State's level (even given the 3 year difference in data year) while Canyon County is below the State of Idaho. In terms of per capita personal income, Canyon County ranked 30th in the state in 1969, 29th in the state in 1979, and 30th in the state in 1998. Thus, over time, its relative position has not changed much.

Education Demographics

Education demographics in Idaho reflect the state's income demographics. In 1990, Canyon County ranked 39th in the state in the percent of population receiving a high school degree. Blaine County was first at 91.7% and Owyhee County was last at 62%. Ada County was third at 87.2%. In terms of the percent of the population with a bachelors degree, Canyon County (12%) ranked 27th, with Latah County being first (35.8%) and Gem County being last (8.6%). The percent of the population with less than a 9th grade education follows the inverse of the previous pattern. Canyon County ranked 6th in the state at 12.6% while Owhyee County was first at 18.5%. Likewise, Blaine County was last at 2.1% (Figure 15).

Medical Demographics

Canyon County ranked relatively high in the availability of medical facilities. It ranked 14th in the state in physicians per 100,000 in 1997, 2nd in the state in hospital beds available, and 2nd in nursing home beds. In the latter two cases, only Ada County ranked higher. In terms of physicians, Blaine Count was first (Figure 16).

Crime/Divorce Demographics

Canyon County ranked 13th in the state in divorce (5.9/1000). Camas County was first (8.3/1000) and Clark County was last at 0%. Canyon County ranked 5th in the state in serious crime statistics reflecting its urbanization. In terms of total offense rate for crime, Canyon County was also ranked 5th place in 1997. (County Profiles reports Canyon County's overall crime rate per 100,000 declined from approximately 6,039 in 1990 to 4,169 in 1999.) Twin Falls County, on the other hand, ranked first in crime for both categories of crime. Lemhi County ranked last in both cases (Figure 18).

Age-Race Demographics

Age and race/ethnicity demographics are reported in Figure 19. One interesting demographic characteristic of Canyon County is its diversity. Hispanics constitute nearly 20% of the county population versus approximately 8% of the state's population.

Public Assistance

Canyon County had 8,595 individuals on Medicaid (the medical program for low income families) in 1999 or 6.2% of the population, versus 3.6% of the population for Ada County. Canyon County had 2,815 individuals receiving food stamps, and 180 individuals on TANF (Temporary Assistance for Needy Families).

Housing

Figure 20 reports county housing units by community. Housing needs drive much urban growth. The largest number of units are in Nampa (19,375), followed by Caldwell (9,603), and Middleton (1,066).

Canyon County Employment and Jobs

The largest single economic sector in Canyon County is services, employing 14,308 in 1998 or 24% of the workforce. This compares to 31% for the USA, 26% for Idaho State, 29% for Ada County, 28% for Nez Perce County, 19% for Idaho County, and 16% for Lewis County. Services, is of course, mostly a nonbase industry, dependent on economic activities that bring income in from outside of the region. The second biggest sector in the county is manufacturing (19%); compared to USA (12%), Idaho State (11%), Ada County (13%), Nez Perce County (15%), Idaho County (13%), and Lewis County (9%).

Retail trade is the 3rd largest sector for Canyon County constituting 15.5% of county employment. Total employment in 1998 was nearly 60,000 workers (Figure 21 and Figure 22).

From 1990-1999, Canyon County experienced a 42.2% increase in employment growth. Ada County had a 55.9% increase, Idaho State increased by 36.7%, Idaho County had only 16.4% rate of growth in the 1990s. The construction sector was the fastest growing sector for Canyon County (143.6%), followed by services (52.9%), manufacturing (47.7%), and the retail trade and finance services sectors at about 41% each (Figure 23).

Three economic sectors actually lost employment in the 1990s, mining (-15.3%), military (-14%), and state government (-17.2%).

Largest Canyon County Employers

Figure 24 lists Canyon County's top employers by community as reported by the Idaho Department of Commerce. *These numbers must be viewed as estimates only and not necessarily comprehensive.* The largest private employers are Micron PC at 1,200 workers and JR Simplot, also at 1,200 workers. These two companies represent the dual economy of Canyon County—high technology and agriculture and agriculture processing. Other big private employers are Kit -trailer manufacturing (592 workers), Armour Foods-meat processing (550 workers), Amalgamated Sugar- sugar processing (500 workers), Zilog –integrated circuit boards (500 workers), MCMS-custom computer boards (460 workers), SSI-meat processing (400 workers), Nestle-food processing (350 workers), and Woodgrain Milwork – wood processing (350 workers).

The largest institutional employers include the Nampa School District (1300 workers), Mercy Medical Center (650 workers), and Albertson College (460 workers).

Unemployment Rates

The covered unemployment rate for Canyon County for March 2002 was estimated at 5.8% seasonally adjusted. This is up from a low of 4.5% in year 2000. The highest unemployment rate in the state is Adams County (12.6%), followed by Clearwater County (12%), Shoshone County (10.9%), and Benewah County (10.6%). These are all wood products dependent economies. The counties with the lowest unemployment rates are Madison (1.5%), Camas (2.1%), and Butte (3.2%).

For Idaho State, the unemployment rate stood at 5.3% in March 2002. Canyon County's covered employment stood at 65,232 employees in March 2002. Covered

employment includes all employers paying unemployment insurance premiums. It excludes self-employed individuals (Figure 25 and Figure 26).

Canyon County Earnings

Figure 27 illustrates earning by industry for selected regions, for both 1979 and 1998, as percentages of total earnings. The top Canyon County industry in 1998 was manufacturing (26% of total earnings) versus 23% in 1979. Note that for employment, the share of the economy in manufacturing in 1998 was 19%. Thus the share of earnings for manufacturing exceeds the share of employment—implying relatively high paying jobs in the manufacturing sector. In contrast, services constitute a 19% share of earnings but a 24% share of employment, implying relatively lower paying jobs in the service sector.

The earnings share of manufacturing has fallen in the USA from 25% in 1979 to 17% in 1998. In contrast manufacturing grew in Idaho from 19% (1979) to 26% (1998). Canyon County trends are following Idaho in an expanding manufacturing base (Figure 27).

Identifying Individual Industries in a County

Due to disclosure problems, it is not easy to identify individual firms and some economic sectors, especially at the city or county level. State laws prevent the government from publishing statistics that could identify confidential information of privately held firms. This creates obvious problems for economists in conducting economic analyses. Methods have been developed to estimate data suppressions—with varying degrees of accuracy. The economic impact analysis conducted later in this report includes data from Implan, a private firm that provides data for input-output regional economic models. It has its own system for estimating data suppressions.

Earnings by Sector

Figure 28 identifies earnings by sector for Canyon County at a more detailed level than reported earlier. It also contains suppressions identified by the letter (D). The bracketed headings are the major industry totals. Manufacturing, for example, paid out \$389,968,000 in earnings; of which \$80,223,000 occurred in Industrial machinery and equipment; \$70,423,000 in electronic and electric equipment, and \$115,532,000 in food and kindred products (food processing).

Basic (Export) Industries Versus Nonbasic Industries

A county has two types of industries: base industries and nonbase industries. Base industries are defined as any economic activity that brings income into the region when goods are sold by regional firms. For Canyon County the base industries are high technology companies and agriculture food processing, as well as other manufacturing firms. Agriculture, tourism, and the region's consumer and business-related wholesale and retail trade industries also served an economic base function. For example, firms providing services to individuals living outside the region's trade center, such as medical and legal services, were included in the region's base. Payments from state and federal governments (including social security, Medicare, funding for universities, welfare payments) were other sources of outside income to business and residents in Canyon County were counted as part of the economic base.

Nonbase industries are defined as economic activity within a region that support local consumers and businesses within the base sector, recirculating incomes generated within the region. These activities include shopping malls that serve the local population, business and personal services consumed locally, and local construction contracts. Nonbase industries support the base industries.

Base industries are sometimes confused with nonbase industries. Canyon County, for example, had a large service sector that employed 14,308 workers or 24% of the workforce. From these numbers it appeared that the service sector contributed a large amount of economic base employment and earnings to the economy. In reality much of this service sector employment was consumed by local industries and their workers, such as Micron and JR Simplot workers. Only the market activities and employees serving visitors from outside the area were counted as economic base activity and employment. The Case of Nez Perce County is a good example. For the service sector, the portion of the employment dependent on visitor spending (i.e. real base activity) was estimated in a previous study to be only 0.9% of the total local service employment. The service sector on paper, however, constitutes 28% share of total area employment. It was reduced to 0.9% of the employment for inclusion in the economic base (The actual base component was a little larger than 0.9% because part of the service sector exports were included in the central function of the county in that economic model).

Economic base analysis is important for identifying the vital export industries of a region. Nonbase industries, on the other hand, are important for keeping money within a region and stimulating local economic activity for residents. In this respect, nonbase industries can function in the same manner as an export industry. For example, a patient elects surgery at a local hospital instead of traveling to Salt Lake City, Utah. The substitution of local services for an imported service is the equivalent of an increase in demand for local business services. By keeping income in the community, it will have similar multiplier effects as an increase in demand for an export industry. Ultimately, however, nonbase industries depend on the basic industries for their survival.

Canyon County Agriculture

Canyon County has the 2nd (or 3rd) largest agricultural sector in Idaho (depending on how it is measured) and the county has the 2nd largest population in the state. It is both a rural county and an urban county at the same time. Canyon County had 354,919 acres of farms, ranking 17th in the State of Idaho in 1997. Bingham County, in contrast, had 796,069 in farm acres, ranking first in the state. Canyon County had 1,898 farms in 1997, down from 2,009 in 1987. The average farm size was 187 acres, up from 163 in 1987 but down from an average of 209 acres in 1992. The total number of acres planted in crops was 235,077 in 1997, down from 247,966 in 1987.

The total number of irrigated acres in Canyon County were 1,684 in 1997, down from 1,745 acres in 1987. As in most of south Idaho, most of the farmland in the county must be irrigated, due to the lack of rainfall.

Figures 29 and 30 outline agriculture profiles (production and farms) for livestock and crop measures of Canyon County from the last three agricultural census (1997, 1992, 1987). For example, Canyon County had 144,366 cows and calves in inventory in 1997, up from 130,677 in 1987. Other production measures include beef cows, milk cows, hogs and pigs, sheep and lambs, layers and pullets, broilers and other meat type chickens sold. Figure 30 outlines production in barley, beans, alfalfa, potatoes, sugar beets, and grain.

Sales Receipts

Canyon County was 2nd in the state in overall cash receipts from agriculture (\$328,150,000) in 1999, just behind Cassia County (\$374,624,000), as seen in Figure 11.

Canyon County was 6th in the state in livestock cash receipts (\$169,029,000) as seen in Figure 31. Gooding County was 1st at \$269,801,000. Canyon County was 2nd in cash crop receipts at \$160,122,000. Cassia County was first at \$164,604,000 (Figure 32). In terms of farm support payments, Canyon County ranked 14th in the state (Figure 33) at \$6,590,000. Cassia County ranked first (\$15,904,000). Figure 34 illustrates Canyon County's agricultural cash receipts from 1969-1999 in both nominal terms (in current

dollars) and in real terms (adjusted for inflation using the consumer price index). In real terms, overall farm receipts have fallen considerably since the mid-1970s.

Canyon County Farm Output Comparisons

Canyon County ranked 12th in the state of Idaho in potato production (4,000,000 cwt) in year 2000. Bingham County was 1st at 25,104,000 cwt (Figure 35). Total production for potatoes was reported for 1990-2000 in Figure 36. Canyon County ranked 8th in the state in wheat production in 2001 (3,562,000 bushels), and had the highest yield in the state at 107.6 bushels per acre. Bingham County had the largest output in the state at 11,320,000 bushels. Wheat production is reported for the state by county rank in Figure 38, and for Canyon County (1990-2001) in Figure 37. The county was 5th in state in sugar beet production at 457,200 tons in 2000. Minidoka was 1st at 1,123,900 tons of production (Figure 39). Canyon County was 1st in the state in corn for grain production (1,982,000 bushels) (Figure 40), and 4th in corn production for silage at 385,000 tons (Figure 41).

Canyon County was 3rd in the state in hay alfalfa production at 296,000 tons in 2000. Jefferson County was first at 477,600 bushels (Figures 41 and 42). In 2001 Canyon County ranked 18th in the state in barley production at 678,000 bushels. Bonneville County ranked 1st at 4,910,000 bushels (Figure 44). Canyon County ranked 6th in the state in total head of cattle — 123,000 cows and calves. Jerome County was first with 170,000 cows and calves (Figures 43 and 45). Finally Canyon County ranked 5th in the state in sheep and lambs at 19,000 head in 2001. Minidoka was 1st at 33,000 head in 2001 (Figure 46).

Canyon County Economic Impact Assessment

This section of our analysis identifies the causation of economic activity in Canyon County. An input/output model of the economy is used for this purpose.

Economic Profile Versus Economic Base Assessment

Figure 47 reports the total sales, value-added, wages, indirect business taxes, and employment for Canyon County in 1998 by major industry category. Total sales reported in the county in 1998 were \$5,181,225,000. Value added was reported at \$2,262,206,000, total earnings— \$1,299,416,000, indirect business taxes, \$153,939,000, and employment at 59,287 jobs. (Value added is the regional equivalent of gross domestic product (GDP), which is how economists measure the macro economy. Indirect business taxes include all taxes except corporate and

personal income taxes.) This economic profile reports economic activity by sector. It identifies economic activity...but does not explain what drives or causes economic activity. Retail trade and wholesale trade for example, constitutes 19.2% of the employment in Canyon County. Much of this activity is really derived by other major basic export industries. Exports(or base activity) is defined as any activity that brings money into the community (as discussed earlier in this report). Thus much of the trade activity is really derived from food processing and high technology companies.

Figure 49 illustrates the problem of identifying which economic variables should be used in ranking economic activity. Industrial sectors are ranked in Canyon County by sales and alternatively by employment. The top five industries ranked by sales are: 1) construction, 2) food processing (crops), 3) industrial machinery, 4) trade, and 5) food processing (animal). The top five industries ranked by employment are: 1) trade, 2) construction, 3) state and local government, 4) health services, and 5) education services. These widely different rankings illustrate part of the problem of identifying the sources of economic activity. Typically economists focus on earnings and employment measures as the most important and tangible measures of economy activity.

Figure 50 compares an economic profile with an economic basic approach to ranking industries. The top earnings industry with the profile and the economic base is manufacturing. In the economic base approach, however, agriculture-related industries rank second, as opposed to services in the profile. In terms of employment rankings, services and retail trade are ranked 1st and 2nd place. In the economic base assessment agriculture-related businesses and manufacturing were 1st and 2nd place. Clearly agricultural-related businesses and manufacturing and not services and retail trade, drive the Canyon County economy.

What is an Economic Base Assessment?

We created a model of the Canyon County economy using an Implan input/output model. A technical discussion of the model and the supporting mathematics can be found in: M. C. Guaderrama, N. Meyer, and R. G. Taylor, *Developing Coefficients and Building Input-Output Models*, University of Idaho Department of Agricultural Economics and Rural Sociology, September 2000.

Our model creates an economic base assessment of the economy. It is an approximate measurement of the causation of economic activity. For example, the trade sector (retail and wholesale trade) which officially employs 19.2% of the county's employment is

actually responsible for only 1.9% of the region’s employment. This occurs because most of retail trade is endogenous to the economy, dependent on other industries that bring money into the county from outside the region. Two factors determine the size and magnitude of export or basic activity: 1) the magnitude in dollars of exports in an industrial sector (i.e. sales outside the county) and 2) magnitude of the multiplier. The multiplier identifies the backward linkages of each industrial sector into the economy (type 1 multiplier); along with the impacts of employee spending (type 2 multiplier). The greater the backward linkages (*ceteris paribus*), the greater the multiplier. For example, for each dollar of processed meat sold outside the county, there exists a huge supporting “cast” of industries inside the county. The processing plants purchase much of their raw materials and supplies from other firms inside the county (although some purchases are made outside the county which constitutes leakages or imports). The primary input is cattle raised in feedlots, which is a major industry in its own right in Canyon County. Cattle are fed from alfalfa hay, corn, wheat, and potato wastes grown on farms in the county. Thus each dollar of processed meat exported sets off a chain reaction of rounds of spending— from direct suppliers, to feedlots, to basic agriculture, and finally through related employee spending. Putting this effect in dollar terms, each dollar of exports of processed meats creates over \$1.9 in total sales in Canyon County.

A listing of unadjusted exports can be seen in Figure 48. The largest export sector is food processing (crops) at \$554.5 million dollars, followed by food processing (animal) \$365.6 million, industrial machinery \$172.4 million, wood products \$130.5 million, and construction \$122.6 million. Exports do not tell the entire story however, as noted earlier. The size of the backward linkages (and magnitude of employee spending) must be factored in by the multiplier to calculate the total magnitude of each basic industry.

Basic Industries of Canyon County

Total agriculture and agricultural processing constitutes 32.4% of total sales in Canyon County, 22.7% of value added, 20.8% of wages, 26.1% of indirect business taxes, and 23.6% of employment. Most of the basic agriculture in the county is absorbed in forward linkages, and relatively little is sold outside the county. Specialty crops such as seed production are the exception. Most traditional crops go into food or meat processing or directly into the feedlots. Thus agriculture-related export sales outside the region come mostly from food or meat processing.

Manufacturing in Canyon County constituted 27.1% of sales, 24.6% of value added, 25.3% of wages, 19.8% of indirect business taxes, and 20.5% of employment. Roughly 39% of all jobs in the manufacturing sector come from high-technology related jobs.

Economic Growth of the Canyon County Economy

What does the future hold for Canyon County? Agriculture related industries constitute 32.4% of sales and 23.6% of employment. Historically, it has been the largest component of the economy. Agriculture is a mature industry, however, and not likely to have opportunities for major expansions. It will, however, have opportunities for expanding niche markets, both in specialty corps and agricultural related businesses. The bulk of the future expansion will likely occur from three sources: 1) expansion of existing businesses, 2) new businesses and industries moving into the region—many in the high technology and service sectors, and 3) residential growth from Boise. Growth creates both opportunities and challenges. Clearly economic growth (particularly enhanced average incomes) is needed given the economic and social demographics discussed earlier. Canyon County has a robust and prosperous economy but it also has a fairly high level of poverty—and the accompanying social problems associated with that poverty.

Several key issues emerge when considering the effects of economic growth: 1) Is the newly expanding high technology and service economy in conflict with the existing economic base of Canyon County (primarily agriculture)? 2) What is the economic cost of reducing or eliminating the older basic industries in Canyon County such as agriculture? 3) Can Canyon County have both new growth while maintaining its older economic base?

These issues are explored in the next section of this report. First, it is important to identify the economic costs of reducing or eliminating agriculture and agricultural related industries.

Value of Cultivated Cropland to Agriculture

Agriculture (non-livestock) generated \$ 128,401,000 in sales receipts in 1998. If we divide this by the total number of harvested cropland acres (196,689 acres); we arrive at

Figure 52
Value Per Acre of Harvest Cropland

	Harvested Cropland (farms)	Harvested cropland (acres)
Sales \$	1,245,180	\$ 8,534
Wages \$	200,247	\$ 1,372
Indirect Business Taxes \$	29,751	\$ 204
Employment	10.397	0.071

\$652.81 sales/acre of value to agriculture. If we assume all agriculture including agriculture processing and meat processing is dependent on harvested cropland, then total agriculture related sales/acre is equal to \$7,064 (\$1,389,457,000 divided by 196,689). This analysis is based on reported sales by industry as part of the economic profile of the county. It does not address the source or causation of economic activity. Thus a better approach is to utilize an economic base analysis to estimate the value of harvested farm ground.

Using an economic base approach, the total economic value of cultivated farm ground can be estimated on a per farm or per acre measure, as seen in Figure 52 using an input/output model. Each acre of cultivated farm ground causes \$8,534 of sales per year, \$1,372 in wages, \$204 in indirect business taxes, and 0.071 in jobs.

This is based on total agriculture related economic impacts of: sales \$1,678,502,979, value-added of \$513,649,363, earnings \$269,933,121, indirect business taxes \$ 40,104,450, and 14,015 jobs. Total harvested cropland consisted of 196,689 acres as discussed earlier.

Each average size farm causes total sales of \$1,245,180; wages of \$200,000; indirect business taxes of \$29,751; and jobs of 10.4. Total number of farms as estimated by the United States Department of Agriculture (USDA) is 1,348. Since food and meat processing are directly tied economically to farm output, these impacts are included in this analysis. The average size farm in this analysis has 145.9 harvestable acres.

This analysis assumes a continuous and linear relationship between land taken out of agriculture and economic activity dependent on that land. Suppose that a nonlinear relationship exists, these numbers could rise sharply. The key question here is the degree of dependence of agricultural processing (crops), feed lots, and meat processing. Can these industries survive if 20% of land goes out of production? 30%? 50%. Is there a critical amount of land needed to keep processing in business?

Economic Trade-offs

Manufacturing is the second largest basic industry in Canyon County. Nearly 40% of the employment in manufacturing is in high technology companies. Expansion of these economic sectors will be an important growth engine in the future. The character of this growth is important, however. If the new manufacturing facilities and housing tracts of the employees locate on irrigated farmland, then this growth comes with an economic trade-off. Every acre taken out of production will reduce aggregate economic sales in the county by \$8,535 per year. The benefits of new manufacturing jobs would have to be weighed against the cost of lost agriculture-related sales. On the other hand, if new manufacturing facilities and related employee housing tracts are located on somewhere other than on irrigated farmland, then we do have this trade-off. It is a “win-win” situation. The same is true with the expansion of any other industries, services, or retail trade.
